Attempt : 1
Total Mark : 10
Marks Obtained : 6

Section 1 : Coding

1. Problem Statement:

Emily has a beautiful circular garden in her backyard. She's interested in calculating two important measurements for her garden: the circumference and the area. To do this, she needs a program that can take the radius of her circular garden as input and provide the calculated circumference and area as output. The formulas she should use are as follows:

To calculate the circumference (C) of a circle, you can use the formula:

$$C = 2 * \pi * r$$

$$A = \pi * r^2$$

Where:

C represents the circumference.

A represents the area.

π (pi) is approximately 3.14159.

r is the radius of the circle.

Emily is not a programmer, and she needs your help to create a program that will make these calculations for her garden.

Input Format

The first line of input contains a single double-point number radius, representing the radius of the circle.

Output Format

The output should consist of two lines:

The first line should print the circumference of the circle rounded to 2 decimal places, followed by the unit "meters".

The second line should print the area of the circle rounded to 2 decimal places, followed by the unit "square meters".

Refer to the sample output for formatting specifications.

Sample Test Case

Input: 3.0

Output: Circumference: 18.85 meters

Area: 28.27 square meters

Answer

```
import java.util.Scanner;  
import java.text.DecimalFormat;
```

```
public class Main
```

```
{
```

```
public static void main(String[] args)
{

    Scanner sc = new Scanner(System.in);
    double radius = sc.nextDouble();
    double circumference = 2 * Math.PI * radius;
    double area = Math.PI * radius * radius;
    DecimalFormat df = new DecimalFormat("0.00");
    System.out.println("Circumference: " + df.format(circumference) + "
meters");
    System.out.println("Area: " + df.format(area) + " square meters");
}

}
```

Status : Partially correct

Marks : 6/10
